9080 EASYPOXY SATIN ADDITIVE

9080 Easy epoxy Satin Additive when blended into any Easy epoxy color, Satin Additive will produce a semi-gloss to semi-flat finish often desired for non-glare deck surfaces and interiors.

There is no set ratio of Satin Additive to paint; the more you add, the flatter the finish. As a starting point, mixing 1/2 pint of Satin Additive into a quart of Easy epoxy color will produce an effect similar to our standard semi-gloss white.

Thoroughly stir, or mechanically shake, the Satin Additive to be sure the flattening agent is not settled at the bottom. Slowly add the desired amount of the paint, stirring continuously for thorough blending. During application, stir the paint occasionally to prevent the Satin Additive from setting.

NOTE: Generally, high gloss finishes are more resistant to weathering than are semi-gloss paint will be subjected to harsh sunlight and salt spray.
