

Pettit Protect uses long, wide sheets of overlapping Mica to create an impenetrable, structural barrier against water absorption.

**OBVIOUSLY PETTIT PROTECT®
EPOXY PRIMER IS THE
BETTER PROTECTION AGAINST
WATER ABSORPTION**

All premium epoxy primers contain Mica to prevent water intrusion. Pettit Protect incorporates slate Mica into the epoxy resin, which is longer, wider and overlaps like a roof, creating an impenetrable structural barrier. Other companies use ground Mica and when applied, there is no structure, only minute particles, like gravel. And with Pettit Protect you apply less coats, which means less work and less time.
